QED Lagrangian is

$$\mathcal{L}_{QED} = \bar{l}(i\not{D} - m)l + \bar{N}(iD^0)N - \mathcal{L}_\gamma \quad (1)$$

Set the NRQED Lagrangian as (take large  $M$  limit where  $M$  is the mass of the proton/hydrogen nucleus)

$$\mathcal{L}_{NRQED} = \psi^\dagger(iD_0 + \frac{\mathbf{D}^2}{2m})\psi + \bar{N}(iD_0)N + \mathcal{L}_{4-fer} + \mathcal{L}_\gamma \quad (2)$$

In tree level<sup>1</sup>

Note that after the expansion over external momentum,  $k^i$  can be converted into  $p^i$  so it's actually at  $p^1$  order.

Now consider operator product expansion.

Tree level matching: 

$$\begin{aligned}\langle 0|T\psi(x)N(0)|pP_N\rangle &= \text{diagram} = u_e(p)u_N(P_N)e^{-ip\cdot x} \\ \langle 0|T\psi_e(x)N(0)|pP_N\rangle &= \text{diagram} = \psi_e(p)u_N(P_N)\end{aligned}$$

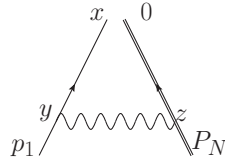

At leading order  $u_e(p) = \begin{pmatrix} \psi_e(p) \\ 0 \end{pmatrix}$ . (If we're only interested in the hard region contribution, which is independent of states, the leading order is independent of any on-shell momentums.)

we can see there's no UV divergence here. IR divergence is presented but it's exactly the same with the NRQED one so there's nothing that needs to concern about.

we can see it's UV logarithm divergent and IR logarithm divergent (only for the  $p_1^0 \approx m^2$  term). Now we must regularize it to dimension  $(d-1)$

## 2 HSET

### 2.1 Lagrangian

For scalar QED

$$\mathcal{L} = (D_\mu \phi)^\dagger D^\mu \phi - m^2 \phi^\dagger \phi$$

where

$$D_\mu = \partial_\mu + ieA_\mu$$

In Schwartz's QFT (Chap. 35) he mentioned a choice of  $\chi_v$  and  $\tilde{\chi}_v$ :

$$\phi(x) = e^{-imv \cdot x} \frac{1}{\sqrt{2m}} (\chi_v(x) + \tilde{\chi}_v(x)) \quad (3)$$

$$\chi_v(x) = e^{imv \cdot x} \frac{1}{\sqrt{2m}} (iv \cdot D + m) \phi(x), \quad \tilde{\chi}_v(x) = e^{imv \cdot x} \frac{1}{\sqrt{2m}} (-iv \cdot D + m) \phi(x) \quad (4)$$

Put (3) into (4), a simple relation is derived:

$$(-iv \cdot D) \chi_v(x) = (2m + iv \cdot D) \tilde{\chi}_v(x)$$

It can also be written as

$$2m \tilde{\chi}_v = (-iv \cdot D) (\chi_v + \tilde{\chi}_v)$$

Use this result

$$\begin{aligned} \mathcal{L} &= \frac{1}{2m} \left\{ [D^\mu (\chi_v + \tilde{\chi}_v)]^\dagger + imv^\mu (\chi_v + \tilde{\chi}_v)^\dagger \right\} \left\{ [D_\mu (\chi_v + \tilde{\chi}_v)] - imv_\mu (\chi_v + \tilde{\chi}_v) \right\} - m^2 (\chi_v + \tilde{\chi}_v)^\dagger (\chi_v + \tilde{\chi}_v) \Big\} \\ &= (\chi_v + \tilde{\chi}_v)^\dagger (iv \cdot D) (\chi_v + \tilde{\chi}_v) + \frac{1}{2m} [D^\mu (\chi_v + \tilde{\chi}_v)]^\dagger D_\mu (\chi_v + \tilde{\chi}_v) \end{aligned} \quad (5)$$

$$= (\chi_v(x) + \tilde{\chi}_v(x))^\dagger (iv \cdot D) (\chi_v(x) + \tilde{\chi}_v(x)) + \mathcal{O}\left(\frac{1}{m}\right) \quad (6)$$

(note that  $D_\mu \phi = e^{-imv \cdot x} [D_\mu (\chi_v + \tilde{\chi}_v) - imv_\mu (\chi_v + \tilde{\chi}_v)]$  and  $-imv^\mu [D_\mu (\chi_v + \tilde{\chi}_v)]^\dagger (\chi_v + \tilde{\chi}_v) = imv^\mu (\chi_v + \tilde{\chi}_v)^\dagger D_\mu (\chi_v + \tilde{\chi}_v) - \text{total derivative term}$ )

Use the leading order of (5)

$$\begin{aligned} \mathcal{L}^{(0)} &= (\chi_v + \tilde{\chi}_v)^\dagger (iv \cdot D) (\chi_v + \tilde{\chi}_v) \\ &= \chi_v^\dagger iv \cdot D \chi_v + \tilde{\chi}_v^\dagger iv \cdot D (\chi_v + \tilde{\chi}_v) + \chi_v^\dagger iv \cdot D \tilde{\chi}_v \\ &= \chi_v^\dagger iv \cdot D \chi_v - 2m \tilde{\chi}_v^\dagger \tilde{\chi}_v + (iv \cdot D \chi_v)^\dagger \tilde{\chi}_v \\ &= \chi_v^\dagger iv \cdot D \chi_v - 2m \tilde{\chi}_v^\dagger \tilde{\chi}_v + [(-2m - iv \cdot D) \tilde{\chi}_v]^\dagger \tilde{\chi}_v \\ &= \chi_v^\dagger iv \cdot D \chi_v - \tilde{\chi}_v^\dagger (iv \cdot D + 4m) \tilde{\chi}_v \end{aligned}$$

We can have the final form<sup>6</sup>

$$\mathcal{L} = \chi_v^\dagger iv \cdot D \chi_v - \tilde{\chi}_v^\dagger (iv \cdot D + 4m) \tilde{\chi}_v + \mathcal{O}\left(\frac{1}{m}\right)$$

### 2.2 Quantization

#### 2.2.1 HQET as an example

The leading term of HQET Lagrangian is

$$\mathcal{L} = \bar{Q}_v (iv \cdot D) Q_v$$

---

<sup>6</sup>With one problem: if we can tolerate coupled particle-anti particle pair, we can trade  $iv \cdot D$  for mass term, so the leading part is the same but the anti-particle part could be different with the mixing?

$$Q_v(x) = e^{imv \cdot x} \frac{1 + \not{v}}{2} \psi(x)$$

In free Dirac fermion theory we know that

$$\begin{aligned} \{\psi_a(\mathbf{x}), \psi_b^\dagger(\mathbf{y})\} &= \delta^{(3)}(\mathbf{x} - \mathbf{y}) \delta_{ab} \\ \{a_{\mathbf{p}}, a_{\mathbf{p}'}^\dagger\} &= (2\pi)^3 \delta^{(3)}(\mathbf{p} - \mathbf{p}') \end{aligned}$$

also the plane wave expansion of  $\psi$  is

$$\begin{aligned} \psi(x) &= \int \frac{d^3p}{(2\pi)^3} \frac{1}{\sqrt{2E_p}} a_{\mathbf{p}} u(p) e^{-ip \cdot x} \\ &= \int \frac{d^3k}{(2\pi)^3} \frac{1}{\sqrt{2mv^0}} a_v \sqrt{m} u(v) e^{-imv \cdot x - ik \cdot x} \end{aligned}$$

using normalization of states  $u(k) = \sqrt{m} u(v)$ <sup>7</sup>,  $\langle p' | p \rangle = 2E_p (2\pi)^3 \delta^{(3)}(\mathbf{p}' - \mathbf{p})$  and  $\langle v', k' | v, k \rangle = 2v^0 \delta_{vv'} (2\pi)^3 \delta^{(3)}(\mathbf{k}' - \mathbf{k})$  we have  $|p\rangle = \sqrt{m} |v\rangle$  ( $|p\rangle = \sqrt{2E_p} a_{\mathbf{p}}^\dagger |0\rangle$  while  $|v, k\rangle = \sqrt{2v^0} a_{v, \mathbf{k}}^\dagger |0\rangle$ )

$$= \int \frac{d^3k}{(2\pi)^3} \frac{1}{\sqrt{2v^0}} a_v u(v) e^{-imv \cdot x - ik \cdot x}$$

Using the definition of  $Q_v(x)$

$$\begin{aligned} Q_v(x) &= e^{imv \cdot x} \frac{1 + \not{v}}{2} \psi(x) \\ &= \int \frac{d^3k}{(2\pi)^3} \frac{1}{\sqrt{2v^0}} a_v \frac{1 + \not{v}}{2} u(v) e^{-ik \cdot x} \\ &= \int \frac{d^3k}{(2\pi)^3} \frac{1}{\sqrt{2v^0}} a_v u(v) e^{-ik \cdot x} \end{aligned}$$

The commutation relation should be

$$\{Q_{va}(\mathbf{x}), Q_{v'b}(\mathbf{x}')\} = \int \frac{d^3k}{(2\pi)^3} \frac{d^3k'}{(2\pi)^3} \frac{1}{\sqrt{4v^0 v'^0}} \{a_v, a_{v'}^\dagger\} u_a(v) u_b^\dagger(v') e^{-ik \cdot x + ik' \cdot x'}$$

using  $\sum_s u_a(v) u_b^\dagger(v) = \frac{1}{m} \sum_s u_a(p) u_b^\dagger(p) = [(\not{v} + 1)\gamma^0]_{ab}$

$$= \int \frac{d^3k}{(2\pi)^3} \frac{d^3k'}{(2\pi)^3} \frac{1}{\sqrt{4v^0 v'^0}} \{a_v, a_{v'}^\dagger\} [(\not{v} + 1)\gamma^0]_{ab} e^{-ik \cdot x + ik' \cdot x'}$$

assuming  $\{a_v, a_{v'}\} = (2\pi)^3 \delta_{vv'} \delta^{(3)}(\mathbf{k} - \mathbf{k}')$

$$\begin{aligned} &= \int \frac{d^3k}{(2\pi)^3} \frac{1}{2v^0} [(\not{v} + 1)\gamma^0]_{ab} e^{-ik \cdot (x - x')} \delta_{vv'} \\ &= \left[ \frac{(\not{v} + 1)\gamma^0}{2v^0} \right]_{ab} \delta_{vv'} \delta^{(3)}(\mathbf{x} - \mathbf{x}') \end{aligned}$$

## 2.2.2 HSET

The anti-particle field is decoupled so we don't have to consider that for now. The equation-of-motion is

$$\begin{cases} v \cdot D \chi_v^\dagger = 0 \\ v \cdot D \chi_v = 0 \end{cases}$$

By definition

$$\begin{aligned} \chi_v(x) &= \frac{e^{imv \cdot x}}{\sqrt{2m}} (iv \cdot D + m) \phi(x) \\ &= \frac{1}{\sqrt{2m}} (iv \cdot D + 2m) e^{imv \cdot x} \phi(x) \end{aligned}$$

Obviously the plane wave expansion should be irrelevant of the heavy particle mass, which means the exponential part is  $e^{-ik \cdot x}$  where  $k$  marks the offshellness.

<sup>7</sup>The relation  $\bar{u}^s(p) \gamma^\mu u^s(p) = 2p^\mu$  can be derived using Gordon identity, same for  $\bar{u}^s(v) \gamma^\mu u^s(v) = 2v^\mu$ , but it's actually  $\bar{u}u$ .
