## 1 Hydrogen Wavefunction Divergence Near Origin in Dirac Equation and Schrödinger Equation

### 1.1 The Dirac part

The Dirac Hydrogen Equation is

$$(\boldsymbol{\alpha} \cdot \mathbf{p} + \beta m - \frac{Z\alpha}{r})\Psi = E\Psi \quad (1)$$

For the bound state, the wavefunction is

$$\Psi_{1, \frac{1}{2}, \frac{1}{2}}^+ = \begin{bmatrix} \frac{ic\sqrt{m+E}\rho^\gamma e^{-\frac{\rho}{2}}}{r} \sqrt{\frac{1}{4\pi}} \begin{bmatrix} 1 \\ 0 \end{bmatrix} \\ -\frac{c\sqrt{m-E}\rho^\gamma e^{-\frac{\rho}{2}}}{r} \sqrt{\frac{1}{4\pi}} \begin{bmatrix} \cos \theta \\ \sin \theta e^{i\phi} \end{bmatrix} \end{bmatrix} \quad (2)$$

$$\Psi_{1, \frac{1}{2}, -\frac{1}{2}}^+ = \begin{bmatrix} \frac{ic\sqrt{m+E}\rho^\gamma e^{-\frac{\rho}{2}}}{r} \sqrt{\frac{1}{4\pi}} \begin{bmatrix} 0 \\ 1 \end{bmatrix} \\ -\frac{c\sqrt{m-E}\rho^\gamma e^{-\frac{\rho}{2}}}{r} \sqrt{\frac{1}{4\pi}} \begin{bmatrix} \sin \theta e^{i\phi} \\ \cos \theta \end{bmatrix} \end{bmatrix} \quad (3)$$

where

$$E = m\gamma, \quad \rho = 2\lambda r, \quad \lambda = mZ\alpha, \quad \gamma = \sqrt{1 - Z^2\alpha^2}, \quad c = \sqrt{\frac{Z\alpha}{\Gamma(2\gamma + 1)}} \quad (4)$$

c is the normalization factor for  $\int d^3r |\Psi|^2 = 1$ .

Only keeping the upper component  $\psi_u$ , we need to normalize it again so that  $\int d^3r \psi_u^2 = 1$ . We get an extra normalization factor

$$1 - \frac{\lambda^2}{8m^2} + \frac{2\gamma\lambda}{4m^2r} - \frac{\gamma^2 - \gamma}{8m^2r^2}$$

For convenience, define

$$\Psi' = \frac{\Psi}{2(mZ\alpha)^{\frac{3}{2}}} \quad (5)$$

Now  $\Psi'$  is dimensionless and expand it in  $\alpha$ , we get the origin divergence comes from a term

$$-(Z\alpha)^2 \log(mr) \quad (6)$$

the  $m$  in log could be interpreted as a subtraction point  $\mu$ .

## 1.2 The Schrödinger part

The Hamiltonian is

$$H = H_0 + H_{int} \quad (7)$$

$$H_0 = -\frac{\nabla^2}{2m} - \frac{Z\alpha}{r}, \quad H_{int} = \frac{\nabla^4}{8m^3} - \frac{1}{8m^2} \nabla^2 \frac{Z\alpha}{r} + \frac{1}{4m^2} \frac{Z\alpha}{r^3} \boldsymbol{\sigma} \cdot \mathbf{L} \quad (8)$$

The first term of  $H_{int}$  is the relativistic kinematic  $v^2$  correction, the second one is the Darwin term. The  $H_0$  gives the radial wave functions as follows

$$R_{n0} = \frac{2(mZ\alpha)^{\frac{3}{2}}}{n^{\frac{3}{2}}} e^{-\frac{mZ\alpha}{n}r} F(1-n, 2, \frac{2mZ\alpha r}{n}), \quad E_n = -\frac{Z^2\alpha^2 m}{2n^2} \quad (9)$$

$$R_{k0} = \sqrt{\frac{2}{\pi}} (mZ\alpha)^{\frac{3}{2}} k e^{\frac{\pi}{2k}} |\Gamma(1 - \frac{i}{k})| e^{-imZ\alpha kr} F(1 + \frac{i}{k}, 2, 2imZ\alpha kr), \quad E_k = \frac{mZ^2\alpha^2 k^2}{2} \quad (10)$$

Within perturbation theory,  $E_1^{(1)} = \langle \phi | H_{int} | \phi \rangle$ , in quantum mechanics, the NLO energy correction is

$$E_1^{(1)} = E_1 Z^2 \alpha^2 \quad (11)$$

The NLO correction of the bound state wave function is

$$\sum_{n \neq 1} a_{n1} \phi_{n00} + \int dk a_{k1} \phi_{k00} \quad (12)$$

with

$$a_{n1} = \frac{\langle \phi_{n00} | H_{int} | \phi_{100} \rangle}{E_1 - E_n} \quad (13)$$

The relativistic correction is the same with Klein-Gordon equation

$$\Phi^{(1)}(0)_{kin} = \int_{\lambda}^{\frac{\Lambda}{m}} dk (Z\alpha)^2 \left( \frac{1}{\pi} + \frac{1}{k} \right) \quad (14)$$

$$\sim (\alpha Z)^2 \left( \frac{\Lambda}{\pi m} + \log \left( \frac{\Lambda}{m} \right) \right) \quad (15)$$

The UV divergent part of Darwin term is

$$\Phi^{(1)}(0)_D \sim -\frac{\alpha^2 \Lambda Z^2}{2\pi} - \frac{1}{2} \alpha^2 Z^2 \log(\Lambda) \quad (16)$$

Now collect all the results we get as follow.

The Dirac wave function's origin UV divergence is

$$Dirac \text{ UV} : \frac{Z^2\alpha^2}{16m^2r^2} + \frac{Z\alpha}{2mr} - \frac{(Z\alpha)^2}{2} \log(mr) \quad (17)$$

The perturbative Schrödinger wave function's origin UV divergence, with a  $k$  cutoff  $\frac{\Lambda}{m}$ , is

$$Kin \text{ UV} : (\alpha Z)^2 \left( \frac{\Lambda}{\pi m} + \log \left( \frac{\Lambda}{m} \right) \right) \quad (18)$$

$$Darwin \text{ UV} : -\frac{\alpha^2 \Lambda Z^2}{2\pi} - \frac{1}{2} \alpha^2 Z^2 \log(\Lambda) \quad (19)$$

All the  $m$ , under  $\Lambda$  or in a log, can be interpreted as a subtraction point  $\mu$ .

## 2 Non-relativistic QED (NRQED) Matching

### 2.1 Feynman Rules

#### 2.1.1 QED

Lagrangian

$$\mathcal{L}_{QED} = \bar{\psi}(i\not{D} - m)\psi + \Phi_v^* i v \cdot D \Phi_v \quad (20)$$

with

$$D_\mu \phi = \partial_\mu \phi + ie A_\mu \phi$$

and

$$D_\mu \Phi_v = \partial_\mu \Phi - iZe A_\mu \Phi_v$$

But note that no  $\mathbf{A}$  can appear in actual calculation because here only static scalar potential exists. And the Feynman rules are standard QED and HQET Feynman rules except that photons only appear as zero component of Coulomb gauge photon to describe Coulomb potential exchange.

Here  $v$  satisfies  $v^2 = 1$  and the  $k$  with it stands for the offshellness of the propagating momentum.

#### 2.1.2 NRQED

Using the Foldy-Wouthuysen transformation, we can have the Lagrangian

$$\mathcal{L}_{NRQED} = \bar{\psi}_e \left( iD_0 + \frac{\mathbf{D}^2}{2m} \right) \psi_e + \delta\mathcal{L} + \Phi_v^* i v \cdot D \Phi_v \quad (21)$$

with the same notation above. Here  $\mathbf{D} = \nabla - ie\mathbf{A}$ .

Feynman rules are also the same except for the scalar electron side which becomes

We can ignore all interacting terms involving  $\mathbf{A}$ .

Another way to achieve it is to use the transform rules of heavy quark effective theory (HQET) and change the power counting.

## 2.2 LO Matching

### 2.2.1 QED

In tree level<sup>1</sup>

$$i\mathcal{M}_{QED}^{(0)} = \begin{array}{c} P_N = \\ \downarrow q \\ p_1 \rightarrow \quad \rightarrow p_2 \end{array} \begin{array}{c} P_N \\ \uparrow \\ \text{wavy line} \\ \downarrow \\ p_2 \end{array} = -e^2 \bar{u}_N(P_N) v^0 u_N(P_N) \frac{i}{\mathbf{q}^2} \bar{u}_e(p_2) \gamma_0 u_e(p_1)$$

### 2.2.2 NRQED

$$i\mathcal{M}_{NRQED}^{(0)} = \begin{array}{c} P_N \text{---} P_N \\ \downarrow q \\ p_1 \text{---} p_2 \end{array} = -e^2 \bar{u}_N(P_N) v^0 u_N(P_N) \frac{i}{\mathbf{q}^2} \psi^\dagger(p_2) \psi(p_1)$$

Using Dirac representation, the Dirac spinor is

$$u_e(p) = \sqrt{\frac{p^0 + m}{2p^0}} \begin{pmatrix} \psi(p) \\ \frac{\mathbf{p} \cdot \boldsymbol{\sigma}}{p^0 + m} \psi(p) \end{pmatrix}$$

Expand to  $v^2$  order, we have an extra vertex  $\frac{\mathbf{p}_1^2 + \mathbf{p}_2^2 - 2\mathbf{p}_1 \cdot \mathbf{p}_2 - 2i(\mathbf{p}_1 \times \mathbf{p}_2) \cdot \boldsymbol{\sigma}}{8m^2}$  which is exactly those terms with denominator  $1/8m^2$  in BBL<sup>2</sup>.

Rather than write down the effective electron-photon vertex up to  $\mathcal{O}(v^2)$

$$\left[1 - \frac{(\mathbf{p}_1 + \mathbf{p}_2)^2 - 2i(\mathbf{p}_1 \times \mathbf{p}_2) \cdot \boldsymbol{\sigma}}{8m^2}\right]$$

we can add an additional vertex

$$= ie \frac{(\mathbf{p}_1 + \mathbf{p}_2)^2 - 2i(\mathbf{p}_1 \times \mathbf{p}_2) \cdot \boldsymbol{\sigma}}{8m^2}$$

### 3 Local Operator and Matrix Element of NRQED

### 3.1 NLO

$$\langle 0 | \psi_e(0) N(0) (-ie\mu^{-\epsilon}) \int d^4 y \bar{\psi}_e \psi_e A^0 (-ie\mu^{-\epsilon}) \int d^4 z \bar{N} N A^0 | eN \rangle =$$

which doesn't have logarithm divergence. We can rigorously prove that so long as there's no dynamic photon, NRQED has no logarithmic divergence at one loop order (at least for this problem we're considering).

---

<sup>1</sup>Note that there's no Gamma matrix in the heavy particle side, they can only appear in the QED side.

<sup>2</sup>Which contains both Darwin and spin-orbital terms

### 3.2 NNLO

$-$   $= 0 + \text{finite terms}$

$= Z^2 \alpha^2 \left( \frac{1}{2(3-d)} + \log \mu \right) + \text{finite terms}$

$= 0 + \text{finite terms}$

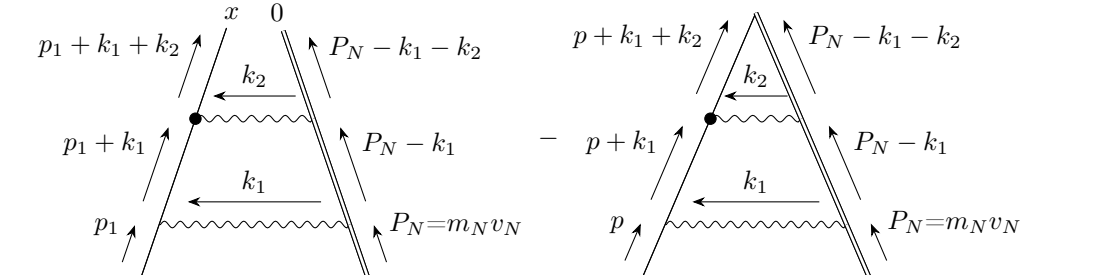

$= Z^2 \alpha^2 \left( \frac{1}{4(d-3)} - \frac{\log \mu}{2} \right) + \text{finite terms}$

$= Z^2 \alpha^2 \left( \frac{1}{2(d-3)} - \log \mu \right) + \text{finite terms}$

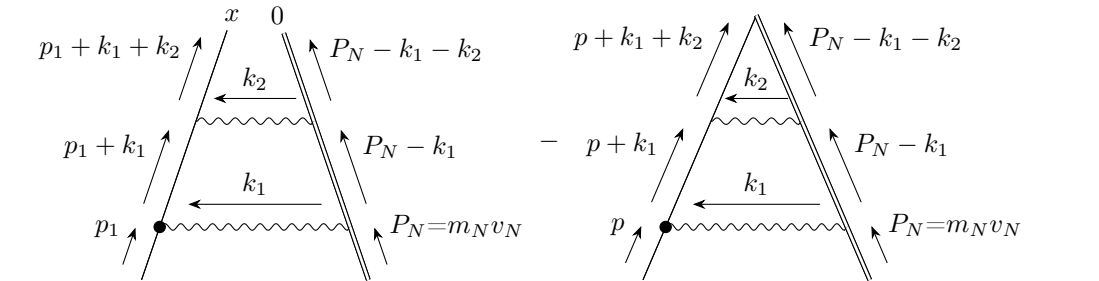

After summing those all together, we can see that the coefficient of  $\log \mu$  is exact the same as which of  $\log \Lambda$  in the Schrödinger wavefunction with  $\mathbf{p}^4$  relativistic correction and of  $\log r$  in Klein-Gordon wavefunction.

## 4 OPE

The relativistic correction part is the same as scalar ones.

$$= -4m^2 \mu^{2\epsilon} Z^2 e^4 \int \frac{d^3 \mathbf{k}_1}{(2\pi)^3} \frac{d^3 \mathbf{k}_2}{(2\pi)^3} [e^{-i\mathbf{k}_2 \cdot \mathbf{x}} - 1] \frac{1}{|\mathbf{k}_1 - \mathbf{p}|^2} \frac{1}{|\mathbf{k}_2 - \mathbf{k}_1|^2} \frac{1}{|\mathbf{k}_1|^2 - 2mE} \frac{(\mathbf{k}_1 + \mathbf{k}_2)^2 / 8m^2}{|\mathbf{k}_2|^2 - 2mE}$$

$$= -4m^2 \mu^{2\epsilon} Z^2 e^4 \int \frac{d^3 \mathbf{k}_1}{(2\pi)^3} \frac{d^3 \mathbf{k}_2}{(2\pi)^3} [e^{-i\mathbf{k}_2 \cdot \mathbf{x}} - 1] \frac{1}{|\mathbf{k}_1 - \mathbf{p}|^2} \frac{1}{|\mathbf{k}_2 - \mathbf{k}_1|^2} \frac{(\mathbf{p} + \mathbf{k}_1)^2 / 8m^2}{|\mathbf{k}_1|^2 - 2mE} \frac{1}{|\mathbf{k}_2|^2 - 2mE}$$
