Note that after the expansion over external momentum, k^i can be converted into p^i so it's actually at p^1 order.

Now consider operator product expansion.

One loop scenario for NRQED case: 
$$\langle 0|\psi_e(0)N(0)e\int \mathrm{d}^4y\bar{\psi}_e\psi_e A^0 e\int \mathrm{d}^4z\bar{N}NA^0|eN\rangle = e^2u_N(P_N)\int[\mathrm{d}k]\frac{1}{\mathbf{k}^2(-k^0+i\epsilon)(p_1^0+k^0-m-\frac{(\mathbf{p_1}+\mathbf{k})^2}{2m}+i\epsilon)}\psi(p_1)$$

2 HSET

2.1 Lagrangian

For scalar QED

$$\mathcal{L} = (D_\mu\phi)^\dagger D^\mu\phi - m^2\phi^\dagger\phi$$

In Schwartz's QFT (Chap. 35) he mentioned a choice of χ_v and $\tilde{\chi}_v$:

$$\phi(x) = e^{-imv\cdot x}\frac{1}{\sqrt{2m}}(\chi_v(x)+\tilde{\chi}_v(x)) \tag{3}$$

$$\chi_v(x) = e^{imv\cdot x}\frac{1}{\sqrt{2m}}(iv\cdot D+m)\phi(x),\ \tilde{\chi}_v(x) = e^{imv\cdot x}\frac{1}{\sqrt{2m}}(-iv\cdot D+m)\phi(x) \tag{4}$$

Put (3) into (4), a simple relation is derived:

$$(-iv\cdot D)\chi_v(x) = (2m+iv\cdot D)\tilde{\chi}_v(x)$$

It can also be writen as

$$2m\tilde{\chi}_v = (-iv\cdot D)(\chi_v+\tilde{\chi}_v)$$

Use this result

$$\begin{aligned}
\mathcal{L} &= \frac{1}{2m}\Big\{\{[D^\mu(\chi_v+\tilde{\chi}_v)]^\dagger + imv^\mu(\chi_v+\tilde{\chi}_v)^\dagger\}\{[D_\mu(\chi_v+\tilde{\chi}_v)] - imv_\mu(\chi_v+\tilde{\chi}_v)\} - m^2(\chi_v+\tilde{\chi}_v)^\dagger(\chi_v+\tilde{\chi}_v)\Big\} \\
&= (\chi_v+\tilde{\chi}_v)^\dagger(iv\cdot D)(\chi_v+\tilde{\chi}_v) + \frac{1}{2m}[D^\mu(\chi_v+\tilde{\chi}_v)]^\dagger D_\mu(\chi_v+\tilde{\chi}_v) \qquad (5) \\
&= (\chi_v(x)+\tilde{\chi}_v(x))^\dagger(iv\cdot D)(\chi_v(x)+\tilde{\chi}_v(x)) + \mathcal{O}(\frac{1}{m}) \qquad (6)
\end{aligned}$$

(note that $D_\mu\phi = e^{-imv\cdot x}[D_\mu(\chi_v+\tilde{\chi}_v) - imv_\mu(\chi_v+\tilde{\chi}_v)]$ and $-imv^\mu[D_\mu(\chi_v+\tilde{\chi}_v)]^\dagger(\chi_v+\tilde{\chi}_v) = imv^\mu(\chi_v+\tilde{\chi}_v)^\dagger D_\mu(\chi_v+\tilde{\chi}_v) - \textit{total derivative term}$)

Use the leading order of (5)

$$\begin{aligned}
\mathcal{L}^{(0)} &= (\chi_v+\tilde{\chi}_v)^\dagger(iv\cdot D)(\chi_v+\tilde{\chi}_v) \\
&= \chi_v^\dagger iv\cdot D\chi_v + \tilde{\chi}_v^\dagger iv\cdot D(\chi_v+\tilde{\chi}_v) + \chi_v^\dagger iv\cdot D\tilde{\chi}_v \\
&= \chi_v^\dagger iv\cdot D\chi_v - 2m\tilde{\chi}_v^\dagger\tilde{\chi}_v + (iv\cdot D\chi_v)^\dagger\tilde{\chi}_v \\
&= \chi_v^\dagger iv\cdot D\chi_v - 2m\tilde{\chi}_v^\dagger\tilde{\chi}_v + [(-2m - iv\cdot D)\tilde{\chi}_v]^\dagger\tilde{\chi}_v \\
&= \chi_v^\dagger iv\cdot D\chi_v - \tilde{\chi}_v^\dagger(iv\cdot D + 4m)\tilde{\chi}_v
\end{aligned}$$

We can have the final form

$$\mathcal{L} = \chi_v^\dagger iv\cdot D\chi_v - \tilde{\chi}_v^\dagger(iv\cdot D+4m)\tilde{\chi}_v + \mathcal{O}(\frac{1}{m})$$

2.2 Quantization

The anti-particle field is decoupled so we don't have to consider that for now. The equation-of-motion is

$$\begin{cases} v\cdot\partial\chi_v^\dagger = 0 \\ v\cdot\partial\chi_v = 0 \end{cases}$$
