# 1 Intro

Hamiltonian [Braaten and Platter(2008)]:

$$\mathcal{H} = \sum_{\sigma} \frac{1}{2m} \nabla \psi_{\sigma}^{\dagger} \cdot \nabla \psi_{\sigma}^{(\Lambda)} + \frac{g(\Lambda)}{m} \psi_{1}^{\dagger} \psi_{2}^{\dagger} \psi_{3} \psi_{4}^{(\Lambda)} + \mathcal{V}$$
 (1)

where the renormalized coupling

$$g(\Lambda) = \frac{4\pi a}{1 - 2a\Lambda/\pi} \tag{2}$$

# 2 Amplitude

Consider:

$$i\mathcal{A} = \langle 34|\psi^{\dagger}\psi|12\rangle =$$
 (3)

Define  $P=p_1+p_2=(E,\mathbf{0}),$  and  $E=p^2/m.$  The integral equation is

$$i\mathcal{A} = -\frac{ig(\Lambda)}{m} \left( 1 + i\mathcal{A} \int \frac{\mathrm{d}^4 k}{(2\pi)^4} \frac{i}{k^0 - \frac{\mathbf{k}^2}{2m} + i\epsilon} \frac{i}{P^0 - k^0 - \frac{|\mathbf{k} - \mathbf{P}|^2}{2m} + i\epsilon} \right)$$
(4)

The integral gives (redefine  $\epsilon \to 2m\epsilon$ )

$$\mathcal{I} = \frac{im}{2\pi^2} \left( -\Lambda + \sqrt{-mE - i\epsilon} \tan^{-1} \left( \frac{\Lambda}{\sqrt{-mE - i\epsilon}} \right) \right) = -\frac{i\Lambda m}{2\pi^2} + \frac{mp}{4\pi}$$
 (5)

and

$$i\mathcal{A} = \frac{-1}{\mathcal{I} + \frac{m}{ig(\Lambda)}} = -\left[\frac{im\sqrt{-mE - i\epsilon}\tan^{-1}\left(\frac{\Lambda}{\sqrt{-mE - i\epsilon}}\right)}{2\pi^2} - \frac{im}{4\pi a}\right]^{-1}$$
(6)

$$\frac{\Lambda \to \infty}{-1/a + \sqrt{-mE - i\epsilon}} \frac{4i\pi/m}{-1/a + \sqrt{-mE - i\epsilon}} \tag{7}$$

Note that by definition, scattering length is the leading order momentum expansion of 1/A, which gives

$$\frac{1}{a} = \frac{4i\pi}{m} \left( \mathcal{I} + \frac{m}{ig(\Lambda)} \right)^{(0)} \tag{8}$$

$$=\frac{4\pi}{g(\Lambda)} + \frac{2\Lambda}{\pi} \tag{9}$$

$$\Rightarrow g(\Lambda) = \frac{4\pi a}{1 - 2a\Lambda/\pi} \tag{10}$$

and this is actually how we get the form of (2).

## 3 OPE

#### 3.1 l.h.s.

Take what we got in the last section as a new non-perturbative vertex, we only need to deal with tree diagram this way. First we have Figure 2(a) in Braaten's paper:

$$P - q = \langle 34 | \psi^{\dagger} \left( -\frac{\mathbf{r}}{2} \right) \psi \left( \frac{\mathbf{r}}{2} \right) | 12 \rangle$$

$$(11)$$

$$= (i\mathcal{A})^2 \int \frac{\mathrm{d}^4 q}{(2\pi)^4} \frac{i}{q^0 - \frac{\mathbf{q}^2}{2m} + i\epsilon} \frac{i}{\left[E - q^0 - \frac{\mathbf{q}^2}{2m} + i\epsilon\right]^2} e^{i\mathbf{q}\cdot\mathbf{r}}$$
(12)

$$= \mathcal{A}^2 \int \frac{\mathrm{d}^3 \mathbf{q}}{(2\pi)^3} \frac{m^2 e^{i\mathbf{q} \cdot \mathbf{r}}}{(\mathbf{q}^2 - p^2 - i\epsilon)^2}$$
 (13)

$$=\frac{im^2\mathcal{A}^2e^{ipr}}{8\pi p}\tag{14}$$

#### 3.2 r.h.s.

For simplicity, we drop the external lines and focus on the internal subgraph. Consider Figure 2(b):

$$y = \langle 34|\psi^{\dagger}\psi(0)|12\rangle_{amp}$$

$$P - q \qquad (15)$$

$$= \int d^4x \int d^4y \int \frac{d^4l_1}{(2\pi)^4} \frac{d^4l_2}{(2\pi)^4} \frac{d^4q}{(2\pi)^4} e^{iP\cdot y} e^{-iP\cdot x} e^{-il_1\cdot y} e^{il_2\cdot x} e^{iq\cdot (x-y)} \tilde{D}(l_1) \tilde{D}(l_2) \tilde{D}(q)$$
(16)

$$= \int \frac{\mathrm{d}^4 q}{(2\pi)^4} \tilde{D}(P-q)\tilde{D}(P-q)\tilde{D}(q) \tag{17}$$

$$= -\int \frac{\mathrm{d}^3 \mathbf{q}}{(2\pi)^3} \frac{m^2}{(\mathbf{q}^2 - p^2 - i\epsilon)^2}$$
 (18)

$$= -\frac{im^2}{8\pi p} \tag{19}$$

where  $\tilde{D}$  marks momentum space propagator and two external vertexes give an  $(i\mathcal{A})^2$  factor. The total contribution is

$$\frac{im^2 \mathcal{A}^2}{8\pi p},\tag{20}$$

the first order Fourier expansion of the l.h.s.

## 3.3 Higher dimensional operators

Figure 2(c) gives

$$y = \langle 34|\psi^{\dagger}\psi^{\dagger}\psi\psi(0)|12\rangle_{amp}$$

$$(21)$$

$$= \int d^4x \int d^4y \int \frac{d^4l_1}{(2\pi)^4} \frac{d^4l_2}{(2\pi)^4} \frac{d^4l_3}{(2\pi)^4} \frac{d^4l_4}{(2\pi)^4} e^{iP\cdot y} e^{-iP\cdot x} e^{-i(l_1+l_2)\cdot y} e^{i(l_3+l_4)\cdot x}$$

$$\tilde{D}(l_1)\tilde{D}(l_2)\tilde{D}(l_3)\tilde{D}(l_4)$$
(22)

which becomes

$$y \underbrace{\int_{P_{1}}^{l_{1}} \frac{l_{2}}{x}}_{P_{2}} x = \int \frac{d^{4}l_{1}}{(2\pi)^{4}} \frac{d^{4}l_{2}}{(2\pi)^{4}} \tilde{D}(l_{1}) \tilde{D}(P - l_{1}) \tilde{D}(l_{2}) \tilde{D}(P - l_{2})$$
(23)

$$= -\int \frac{\mathrm{d}^{3} \mathbf{l_{1}}}{(2\pi)^{3}} \frac{\mathrm{d}^{3} \mathbf{l_{2}}}{(2\pi)^{3}} \frac{m^{2}}{(\mathbf{l_{1}}^{2} - p^{2} - i\epsilon)(\mathbf{l_{2}}^{2} - p^{2} - i\epsilon)}$$
(24)

$$= -\mathcal{I}^2 \tag{25}$$

There're four diagrams in total:

$$= \mathcal{A}^2 \mathcal{I}^2$$

$$= \mathcal{A}\mathcal{I}$$

$$= \mathcal{A}\mathcal{I}$$

$$= \mathcal{A}\mathcal{I}$$

$$(26)$$

$$= \mathcal{A}\mathcal{I}$$

$$(28)$$

$$=1 (29)$$

We have

$$\left\langle \psi_1^{\dagger} \psi_2^{\dagger} \psi_1 \psi_2^{(\Lambda)}(0) \right\rangle_{\pm \mathbf{p}} = (\mathcal{A}\mathcal{I} + 1)^2 \tag{30}$$

in total. Plug in

$$\mathcal{I} = -\frac{m}{ig(\Lambda)} - \frac{1}{\mathcal{A}} \tag{31}$$

we have

$$\left\langle \psi_1^{\dagger} \psi_2^{\dagger} \psi_1 \psi_2^{(\Lambda)}(0) \right\rangle_{\pm \mathbf{p}} = m^2 g^{-2}(\Lambda) \mathcal{A}^2 \tag{32}$$

The Wilson coefficient must be

$$-\frac{r}{8\pi}g^2(\Lambda) \tag{33}$$

#### 4 Contact

#### 4.1 Definition

$$C = \int d^3R \left\langle g^2 \psi_1^{\dagger} \psi_2^{\dagger} \psi_1 \psi_2(R) \right\rangle \tag{34}$$

# 4.2 Energy Relation

According to the Hamiltonian:

$$\mathcal{H} = \left(\sum_{\sigma} \frac{1}{2m} \nabla \psi_{\sigma}^{\dagger} \cdot \nabla \psi_{\sigma}^{(\Lambda)} - \frac{\Lambda}{2\pi^2 m} g^2(\Lambda) \psi_1^{\dagger} \psi_2^{\dagger} \psi_1 \psi_2\right) + \frac{1}{4\pi m a} g^2(\Lambda) \psi_1^{\dagger} \psi_2^{\dagger} \psi_1 \psi_2 + \mathcal{V}$$
(35)

where the matrix elements of those three operators are finite. The  $\nabla \psi_{\sigma}^{\dagger} \cdot \nabla \psi_{\sigma}^{(\Lambda)}$  part gives a linear divergence  $2 \times \frac{\Lambda m \mathcal{A}^2}{4\pi^2}$  for two spin states in total while the other one gives  $-\frac{\Lambda m \mathcal{A}^2}{2\pi^2}$ , we can see that the linear divergence is cancelled. Integrating over positions, we obtain

$$\int d^3R \left\langle \nabla \psi_{\sigma}^{\dagger} \cdot \nabla \psi_{\sigma} \right\rangle = \int d^3R d^3r \delta^{(3)}(\mathbf{r}) \left\langle \nabla \psi_{\sigma}^{\dagger}(\mathbf{R} - \frac{\mathbf{r}}{2}) \cdot \nabla \psi_{\sigma}(\mathbf{R} + \frac{\mathbf{r}}{2}) \right\rangle = \int \frac{d^3\mathbf{k}}{(2\pi)^3} k^2 \rho_{\sigma}(k) \tag{36}$$

$$\frac{1}{4\pi ma} \int d^3R \left\langle g^2 \psi_1^{\dagger} \psi_2^{\dagger} \psi_1 \psi_2 \right\rangle = \frac{1}{4\pi ma} C \tag{37}$$

also notice

$$\int^{\Lambda} \frac{\mathrm{d}^3 \mathbf{k}}{(2\pi)^3} \frac{1}{\mathbf{k}^2} = \frac{\Lambda}{2\pi^2} \tag{38}$$

we have

$$\int d^3R \frac{\Lambda}{2\pi^2 m} \left\langle g^2 \psi_1^{\dagger} \psi_2^{\dagger} \psi_1 \psi_2 \right\rangle = \sum_{\sigma} \int \frac{d^3 \mathbf{k}}{(2\pi)^3} \frac{k^2}{2m} \frac{C}{\mathbf{k}^4}$$
(39)

we achieve

$$E = \sum_{\sigma} \int \frac{d^3k}{(2\pi)^3} \frac{k^2}{2m} \left( \rho_{\sigma}(k) - \frac{C}{k^4} \right) + \frac{C}{4\pi ma} + \int d^3R \langle V \rangle$$
 (40)

## 4.3 Adiabatic relation

Using F-H theorem

$$dE/da = \int d^3R \langle \partial \mathcal{H}/\partial a \rangle \tag{41}$$

it's straightforward that

$$\partial \mathcal{H}/\partial a = g^2 \psi_1^{\dagger} \psi_2^{\dagger} \psi_1 \psi_2 / (4\pi m a^2) \tag{42}$$

We then have

$$\frac{\mathrm{d}E}{\mathrm{d}(1/a)} = -\frac{1}{4\pi m}C\tag{43}$$

using (34).

## 4.4 Viral Theorem

Dimensional analysis requires

$$\left[\omega \frac{\partial}{\partial \omega} - \frac{1}{2} a \frac{\partial}{\partial a}\right] \int d^3 R \langle \mathcal{H} \rangle = 1$$
 (44)

Together with F-H theorem

$$\frac{a}{2}\frac{\partial}{\partial a}\int d^3R \langle \mathcal{H} \rangle = \frac{C}{8\pi ma} + \frac{a}{2}\frac{\partial}{\partial a} \langle \mathcal{V} \rangle = = \frac{a}{2}\frac{dE}{da}$$
 (45)

$$\frac{\partial}{\partial \omega} \int d^3 R \langle \mathcal{H} \rangle = \frac{\partial}{\partial \omega} \langle \mathcal{V} \rangle = \frac{dE}{d\omega}$$
(46)

## 4.5 OPE for number density operators

We have a pair of number density operators

$$\psi_1^{\dagger} \psi_1(\mathbf{R} - \frac{1}{2}\mathbf{r}) \& \psi_2^{\dagger} \psi_2(\mathbf{R} + \frac{1}{2}\mathbf{r})$$

$$\tag{47}$$

and the diagram is

$$= (i\mathcal{A})^2 \int \frac{\mathrm{d}^4 l_1}{(2\pi)^4} \frac{\mathrm{d}^4 l_2}{(2\pi)^4} \frac{i}{l_1^0 - \frac{\mathbf{l_1}^2}{2m} + i\epsilon} \frac{i}{E - l_1^0 - \frac{\mathbf{l_1}^2}{2m} + i\epsilon} \frac{i}{l_2^0 - \frac{\mathbf{l_2}^2}{2m} + i\epsilon} \frac{i}{E - l_2^0 - \frac{\mathbf{l_2}^2}{2m} + i\epsilon} e^{i\mathbf{q}\cdot\mathbf{r}}$$
(49)

$$=\frac{\mathcal{A}^2 m^2}{16\pi^2 r^2} e^{2ipr} \tag{50}$$

Compare with the result of Figure 2(c) (32) we have the Wilson coefficient

$$\frac{g^2(\Lambda)}{16\pi^2 r^2} \tag{51}$$

# 5 Reformulate in Dimensional Regularization

The renormalized Hamiltonian reads

$$\mathcal{H} = \sum_{\sigma} \frac{1}{2m} \nabla \psi_{\sigma}^{\dagger} \cdot \nabla \psi_{\sigma} + Z_{g} \frac{g}{m} \psi_{1}^{\dagger} \psi_{2}^{\dagger} \psi_{3} \psi_{4}$$
 (52)

We have

$$i\mathcal{A} =$$
 (53)

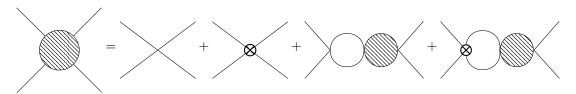

$$\mathcal{I} \equiv \bigvee_{P = k}^{k} \tag{54}$$

The integral equation is

$$i\mathcal{A} = -\frac{iZ_g g}{m} (1 + i\mathcal{A}\mathcal{I}) \tag{55}$$

$$\mathcal{I} \equiv \int \frac{d^{d+1}k}{(2\pi)^{d+1}} \frac{i}{k^0 - \frac{\mathbf{k}^2}{2m} + i\epsilon} \frac{i}{P^0 - k^0 - \frac{|\mathbf{k} - \mathbf{P}|^2}{2m} + i\epsilon}$$
(56)

Graphically we have

or

with one-loop counterterm.

The integral equals to

$$\mathcal{I} = \int \frac{\mathrm{d}^{d+1}k}{(2\pi)^{d+1}} \frac{i}{k^0 - \frac{\mathbf{k}^2}{2m} + i\epsilon} \frac{i}{k^0 - P^0 - \frac{|\mathbf{k} - \mathbf{P}|^2}{2m} + i\epsilon}$$
(57)

$$= \int \frac{\mathrm{d}^d \mathbf{k}}{(2\pi)^d} \frac{i}{P^0 - \frac{\mathbf{k}^2}{2m} - \frac{|\mathbf{k} - \mathbf{P}|^2}{2m} + 2i\epsilon}$$
(58)

$$= \int \frac{\mathrm{d}^d \mathbf{k}}{(2\pi)^d} \frac{mi}{p^2 - \mathbf{k}^2 + i\epsilon} \tag{59}$$

(60)
